Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Cloned colf sequences of mouse 21.6 VH and VL (see AAQ99889) regions are linked to human constant regions in the construction of a humanized antibody against VLA-4. The 5' and 3' ends of the mouse cDNAs are modified using PCR primers (See AAQ99895-98) and then subcloned into mammalian cell expression vectors containing human kappa or gamma-1 constant regions. In the humanized heavy chain, amino acids H27, H28, H39, H30, H44 nd H71 in the human HC VR framework are replaced by the amino acid present in the equivalent position of the mouse 21.6 Ig H chain. Plasmids encoding the chimeric antibodies can be used to inhibit adhesion of a leukocyte to an endothelial cell and to treat inflammatory diseases such as multiple sclerosis. They mainibitely be used in the treatment of stroke, cerebral traumas, meningitis or encephalitis. The antibodies can also be used for anti-invarve antibodies for generating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           61 EQGLEWIGRIDPANGYTKYDPKFQGKATITADTSSNTAYLQLSSLTSEDTAVYFCAREGY 120

mouse anti-alpha-4 integrin monoclonal antibody 21.6. The mouse anti-alpha-4 integrin monoclonal antibody 21.6. The mouse anti-alpha-4 integrin monoclonal antibody 21.6. The complementarity determining regions (CDRs) of the 21.6 VH can be incorporated into a human 21/28 CL framework to produce a claimed humanised 21.6 VH (see AMV22413) and a claimed humanised 21.6 antibody that is used in the manufacture of a medicament for treating a disease selected from asthma, atherosclerosis, AIDS, dementia, diabetes, inflammatory bowel disease, rheumatoid arthritis, transplant rejection, graft versus host disease, tumour metastasis, mephritis, atopic dermatitis, psoriasis, myocardial ischaemia, and acute leukocyte mediated lung injury. The antibody may also be used in the affinity purification of alpha-4 integrin generating idiotypic antibodies. The humanised antibodies of the invention have a half-life in the human isculation essentially equivalent to that of naturally occurring human antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This polypeptide comprises the heavy chain variable region (VH) of mouse anti-alpha-4 integrin monoclonal antibody 21.6. ```
The sequence represents the mouse anti-VLA-4 antibody 21.6 heavy chain variable region (without signal sequence). Cloned CDNA CDR sequences of mouse 21.6 variable light and variable heavy regions are linked to human constant framework regions of the REI antibody for the light chain and the 2*CL antibody for the heavy chain in the construction of a humanized artibody against VLA-4. The 5' and 3' ends of the mouse CDNAs are modified using PCR primers (See AAQ9895-98) and then subcloned into mammalian cell expression vectors containing human kappa or gamma-1 constant regions. In the humanized light chain, amino acids L45, L49, L58 and L69 in the human kappa LVCR framework are replaced by the amino caid present in the equivalent position of the mouse 21.6 Ig light chain. Plasmids encoding the chimeric antibodies are transfected into COS caid present in the equivalent position of the mouse 21.6 Ig light chain. Plasmids encoding the chimeric antibodies are transfected into COS caid present in an endothelial cell and to treat inflammatory diseases such as multiple sclerosis. They can also be used in the traatment of stroke, cerebral traumas, meningitis or encephalitis. The antibodies can also be used for detecting VLA-4, for affinity purification or for generating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              61 DPKFQGKATITADISSNTAYLQLSSLTSEDTAVYFCAREGYYGNYGNYAMDYWGQGTSVT 120

```

```
The heavy chain variable region of murine MAD 84.66 was cloned and sequenced. It was used to produce mouse V-human C antibodies with high affinity for CEA. Chimaeric murine-human anti-CEA Abs are used to diagnose human colon adenocarcinomas.

                                                                                                                                                                                                                                                                                                                                                                                                                                      The gene fragment encoding the V heavy chain region is used to produce a genetically engineered antibody capable of reacting specifically with feline calcivirus (FCV). The antibody can be used to treat, prevent and diagnose FCV infection. It has a broad virus-neutralising spectrum and can be used to neutralise viruses which have acquired immunity to other neutralising antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1 MKCSWVMFFLMAVVTGVNSEVQLQQSGAELVKPGASVKLSCTASGFNIKDTYIHCVKQRP 60
                                                                                                                                                                                                                                                                                                                                            Anti-feline calcivirus recombinant antibody - used to treat, prevent and diagnosis infection and is safe but effective in cats

                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAQ94485 is the plasmid pUC-M21-V(H), which encodes AAR76664 the murine antibody ONS-21 variable heavy chain. The plasmid was used in the construction of an expression vector, congg. cDNA encoding a human/murine chimeric antibody, reactive with human meduiloblastoma (a brain tumour) cells. The chimeric antibody can be used in the diagnosis and treatment of this
                                                                                                                                                                                                                                                                                                                                                                 Reconstituted antibody against human medullo:blastoma cells -contains high proportion of human antibody origin and has low

Interleukin-18: IL-18; human; treatment; autoimmune disease; Mab; immunosuppressant; inhibitor; receptor protein; detection; heavy chain; monoclonal antibody; Mab; variable region.
                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is the heavy chain variable region of the murine anti-human interleukin 5 receptor alpha chain (hIL-5R alpha) monoclonal antibody (kMb) KM1486. KM1486 is produced by the hybridoma FERW BP-5651, which was prepared by immunising Balb/c mice with hIL-5R alpha, fusing spleen cells obtained from the mice with mouse myeloma P3-U1 cells and screening the resultant hybridomas. The MAD can be used to detect or assay for hIL-5R alpha and cells expressing it on their surface, especially to diagnose allergic respiratory diseases, e.g. chronic bronchitis. It can also be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            EQGLEWIGRIDPANGYTKYDPKFQGKATITADTSSNTAYLQLSSLTSEDTAVYFCAREGY 120

This sequence represents the human monoclonal antibody (Mab) #117-10C
heavy chain variable region which is used in a method involved in
neutralising IL18 or to treat autoimmune diseases or as an
immunosuppressant using anti-IL-18 antibodies which can inhibit IL-18.
Compared in missing anti-IL-18 antibodies which can inhibit IL-18.
Such antibodies can also be used to detect the IL-18 receptor protein
(labelled with an enzyme or a radioactive or fluorescent substance). The
protein is used to treat e.g. graft rejection, pernicious anaemia,
compressitio, insulin-resistant diabetes, Wegener granulomatosis,
discoid lupus erythematosis, ulcerative colitis, coladgiuntin-relating
discoid lupus erythematosis, ulcerative colitis, coladgiuntin-relating
cophthalmitis, hyperthyroidism, juvenile onset type diabetes, Sjogren
Syndrome, autoimmune hepatitis, autoimmune haemolytic anaemia, myasthenia
cold haemoglobinuria, polymyositis, periarteritis nodosa, multiple
cold haemoglobinuria, polymyositis, periarteritis, descentis, adisease, climacterium praecox, rheumatoid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ŏ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              g
                                                                                                                                                                                                                                                                            This polypeptide, designated Ha, comprises the heavy chain variable region (VH) of a humanised alpha-4 integrin antibody 21.6 (see also AAW22413). It is composed of complementarity determining regions from the VH region (see AAW2210) of mouse alpha-4 integrin monoclonal antibody 21.6 and a modified human 21/28 CL framework. It can be expressed in mammalian host cells following PCR amplification and mutagenesis of appropriate mouse and human DNA sequences. The nutagenesis of appropriate mouse and human ised 21.6 VL (see AAW22412) can be used humanised 21.6 VH and a humanised 21.6 VL (see AAW22412) can be used to produce a claimed humanised 21.6 artibody that is useful in the manufacture of a medicament for treating asthma, atherosolerosis, arthritis, transplant rejection, graft versus host disease, thumour metastasis, nephritis, aropic dermattis, psoriasis, myocardial arthritis, transplant rejection, graft versus host disease, thumour metastasis, nephritis, aropic dermattis, psoriasis, myocardial ischaemia, and acute leukocyte mediated lung injury. The humanised antibody has a half-life in the human circulation essentially equivalent to that of naturally occurring human antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ;

The present sequence represents the heavy chain variable region of the murine antibody IF1. The antibody has a binding specificity to B7 molecules. The antibody is used to construct humanized immunoglobulins, build comprise an antigen binding region of non-human origin and a portion of a human immunoglobulin. The humanized immunoglobulins are useful for treating autoimmune diseases, infectious diseases, infectious diseases, inflammatory disorders, systemic lupus erythematory bowel disease, inflammatory dermatitis, asthma, arthritis, inflammatory bowel disease, inflammatory dermatitis, and multiple sclerosis. The immunoglobulins are also useful for treating artansplant recipient or preventing transplant recipient, and treating proliferative disease (leukemia, lymphoma and cancer), anaemia (sickle-cell anaemia, thalassemia and aplastic anaemia), inborn errors of metabolism, congenital immunodeficiency diseases, and myeloid dysplasia syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Humanized immunoglobulin having a binding specificity to B7-1 (derived from ATCC PTA-263), or B7-2 (derived from ATCC CRL-12524) molecules, modulates immune responses and can therefore treat e.g. autoimmune

produced by the hybridoma cell line HNK-20. This sequence represents produced by the hybridoma cell line HNK-20. This sequence represents the sequence for the antibody HNK-20 variable heavy chain. HNK-20 is a murine hybridoma cell line, that produces 19A specific for the F glycoprotein of respiratory syncytial virus (RSV). The DNA encoding these sequences were isolated using primers specific for the 5 untranslated region of the variable region, and for the introm downstream of the rearranged J region (see AAT30459-T30545 for primer sequences). The DNA encoding these sequences can be inserted into vectors containing heterologous (such as human) constant region genes, for the production of chimeric and isotype-switched antibodies. The antibodies are useful in the treatment and diagnosis of infection by RSV, such as pneumonia and bronchicilitis, in humans and animals. By using genomic DNA as a template, variable region genes can be isolated without producing fragments that have to be adapted for recombinant antibody expression.
                                                                                                                                                             Antibody; HNK-20; variable heavy chain; hybridoma; murine; IgA; mouse; F glycoprotein; respiratory syncytial virus; RSV; constant region gene; chimeric antibody; isotype-switched antibody; therapy; infection; human; pneumonia; bronchiolitis; animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAR95946-R95948 represent sequences for variable regions of an antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Also, by using the genomic DNA, no knowledge of the DNA sequence encoding the target variable region is required. Chimeric antibodies produced from these proteins, that contain the constant region of the host being treated, are less likely to cause adverse immune reactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DNA encoding variable region of antibody HNK-20 - for treating respiratory syncytial virus infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 15; Fig 5d; 75pp; English

The sequence encodes the mouse antibody 21.6 heavy chain variable region. Ha, directed against leukocyte adhesion molecule VLA-4. Cloned cDNA sequences of mouse 21.6 VL and VN (AAQ99899 and AAQ9992) regions are linked to human constant regions in the construction of a humanized antibody against VLA-4. The 5' and 3' ends of the mouse cDNAs are modified using PCR primers (See AAQ99995-98) and then subcloned into constant regions. In the humanized light chain, amino acids L45, L58 and L69 in the humanized light chain, amino acids L45, L58 and L69 in the humanized light chain, amino acids resent in the equivalent position of the mouse cransfected into COS cells. The humanized antibodies are transfected into COS cells. The humanized antibodies can be used for inhibiting adhesion of a leukocyte to an endothelial cell and contracting inflammatory diseases such as multiple sclerosis. They
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 61 DPKFQGRVTITADTSASTAYMELSSLRSEDTAVYYCAREGYYGNYGVYAMDYWGQGTLVT 120

```

The present sequence represents the heavy chain variable region of the humanised murine antibody IP1. The antibody has a binding specificity to brownised murine antibody IP1. The antibody has a binding specificity to by molecules. The antibody is used to construct humanized immunoglobulins, which comprise an antigen binding region of non-human immunoglobulins are useful for treating autoimmune diseases, infectious diseases, inflammatory disorders, systemic lupus erythematosus, diabetes inflammatory dermatitis, and multiple sclerosis. The immunoglobulins are also useful for treating a transplant recipient, and treating proliferative disease (leukemia, lymphoma and cancer), anaemia (sickle-cell anaemia, thanbasemia and aplastic anaemia), inborn errors of metabolism, congenital immunodeficiency diseases, and myelold dysplasia syndrome.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         δλ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 22, Application US/09865198
Patent No. US20020103345al
GENERAL INFORMATION:
APPLICANT: Zhu, Zhenping
TITLE OF INVENTION: Bispecific Immunoglobulin-Like Antigen Binding Proteins and Methorite Reference: 11245/47102
GURRENT APPLICATION NUMBER: US/09/865,198
GURRENT FILING DATE: 2001-05-24
PRIOR APPLICATION NUMBER: US 60/206,749
PRIOR FILING DATE: 2000-05-24
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 5

Iggamma-1 chain - mouse (fragment)
C;Species: Mus musculus (house mouse)
C;Species: J9-Mar-1997 #sequence_revision 01-Aug-1997 #text_change 21-Jan-2000
C;Accession: 549220
R;Kipp, B.; Becker, W.P.; Schlaak, M.M.
submitted to the EMBL Data Library, September 1994
A;Description: Cloning and expression of a recombinant mouse Fab-fragment recognizing A;Reference number: 549220
                                                                                                                                                                                                                             RTILIMAN, D.M.; Jou, N.T.; Hill, R.J.; Marion, T.N.
J. Exp. Med. 176, 761-779, 1992
A.Tillan, D.M.; Jou, N.T.; Hill, R.J.; Marion, T.N.
J. Exp. Med. 176, 761-779, 1992
A.Tillan and 196 anti-DNA antibodies are the products of clonally selective A.Faference number: PH0971; MUID:92381444; PMID:1512540
A.Accession: PH1012
A.Sactus: nucleic acid sequence not shown
A.Sactus: nucleic acid sequence not shown
A.Residues: 1-108 <TIL>
A.Residues: 1-108 <TIL>
A.Residues: 1-108 <TIL>
C.Superfimental source: B cell, strain [NZB x NZW]F1
C.Superfamily: immunoglobulin V region; immunoglobulin homology
C.Keywords: heterotetramer; immunoglobulin
F;15-98/Domain: immunoglobulin homology <IMM>

VLA-4. Cloned CDNA sequences of mouse 21.6 VL and VH (AAQ99889 and
AAQ99892-1 regions are linked to human constant regions in the
construction of a humanized antibody against VLA-4. The 5' and 3'
ends of the mouse cDNAs are modified using PCR primers (See
AAQ99892-89) and then subcloned into mammalian cell expression vectors
containing human kappa or gamma-1 constant regions. In the humanized
light chain, amino acids L45, L58 and L69 in the humanized
containing human kappa or gamma-1.49, L58 and L69 in the humanized
light chain, amino acids L45, L58 and L69 in the humanized
containing human kappa or gamma-1.

VR framework are replaced by the amino acid present in the equivalent
position of the mouse 21.6 Ig L chain. Plasmids encoding the chimneric
antibodies are transfected into COS cells. The humanized antibodies
can be used for inhibiting adhesion of a leukocyte to an endothelial
cell and for treating inflammatory diseases such as multipp
cell and for treating inflammatory diseases such as multipp
cell and for treating inflammatory diseases such as multipp
cell acid for themingitis or encephalitis. The antibodies can
also be used for detecting VLA-4, for affinity purification or for

This polypoptide, designated La, comprises the light chain variable region (VL) of a humanised alpha-4 integrin antibody 21.6. It is composed of complementarity determining regions (CDRs) from the VL region (see AAW22409) of mouse alpha-4 integrin monoclonal antibody and a modified human REI framework. It can be expressed in mammalian host cells following PCR amplification and mutagenesis of appropriate fragments of mouse and human NAR sequences. The humanised 21.6 VL and a humanised 21.6 VL and a humanised 21.6 VL and be used
 to produce a claimed humanised 21.6 antibody that its useful in the manufacture of a medicament for treating asthma, atherosclerosis, AIDS, dementia, diabetes, inflammatory bowel disease, rheumatoid arthritis, transplant rejection, graft versus host disease, rheumatoid ischaemis, nephritis, atopic dermatitis, psoriasis, myocardial ischaemia, and acute leukocyte mediated lung injury. The antibody for use as a vaccine or an immunogen. It is also useful for generating idiotypic antibodies. The humanised antibody has a half-life in the human circulation essentially equivalent to that of naturally occurring human antibodies.

The sequence represents the mouse anti-VLA-4 antibody 21.6 light chain variable region (without signal sequence). Cloned cDNA CDR sequences of mouse 21.6 variable light and variable heavy regions are linked to human constant framework regions of the REI antibody for the light chain and the 2*CL antibody grainst VLA-4. The 5' and 3' ends of the mususe cDNAs are modified using PCR primers (See AAQ99895-98) and then subcloned into mammalian cell expression vectors containing human kappa or gamma-1 constant regions. In the humanized light chain, amino acids L45, L49, L58 and L69 in the human kappa LCWR framework are replaced by the amino acid present in the equivalent position of the mouse 21.6 Ig light contain the humanized antibodies are transfected into COS acid present in the equivalent position of the mouse 21.6 Ig light collair. The humanized antibodies can be used to inhibit adhesion of a leukocyte to an endothelial cell and to treat inflammatory diseases such as multiple solerosis. They can also be used in the treatment of stroke, cerebral traumas, meningitis or encephalitis. The antibodies can also be used for detecting VLA-4, for affinity purification or for generating anti-diotype antibodies.

The present invention describes fusion proteins comprising a chemokine and a tumour antigen or HIV antigen. Specifically claimed fusion proteins comprise: (1) human monocyte chemotactic protein-3 (MCP-3) and human Muc-1; (2) human interferon-induced protein 10 (IP-10) and human Muc-1; (3) human macrophage-derived chemokine (MDC) and human Muc-1; (4) human Muc-1; (5) human IP-10 and HIV gpl20; (6) human MCP-3 and HIV gpl20; and (8) human SDF-1 and HIV gpl20; (7) human MDC and HIV gpl20; and (8) human SDF-1 and HIV gpl20. The fusion proteins, and nucleotide sequences encoding them, can be used for producing an immune response, e.g. an effector T cell immune preventing HIV infection. The fusion proteins and/or nucleotide sequences can be used in in vitro diagnostic assays, as well as in screening assays from identifying unknown tumour antigen epitopes and fine mapping of tumour antigen epitopes. The present sequence represents a fusion protein

Claim 1; Fig 8; 96pp; English,

```
Hybridoma antibodies have been produced with the spleen cells of BALB/c mouse that had received multiple injections of mercuric ions reacted with glutathione to produce a mercuric ion coordinate covalent compound which was covalently bound to keyhole limpet hemocyanin (KLH). Eight hybridomas (1F10, 4A10, 1C11, 5G4, 23F8, 2D5, 5B6 and 3E8) were producing Mabs that were strongly positive against glutatione-mercuric ions but negative against glutathione without mercuric ions. RNA was isolated from hybridoma cells with guanidine isothiocyanate. First strand cDNA synthesis was catalysed by MuLv reverse transcriptase. The primers used for cDNA synthesis were complementary to the 5' end of the CH1 domain of the heavy creat newscriptase. The primers used for cDNA synthesis are chain expressed by the hybridoma of interest, or to the 5' and of shown in AAQ97511-Q97518. The primer used for cDNA synthesis are
 New polypeptide(s) which bind heavy metals, esp. mercury - derived from monoclonal antibodies, used for detecting, removing, adding or
This is an example of a CDR-grafted light chain of the invention. The constant regions are based on sequences of the human kappa constant domain, the signal sequence is derived from murine MAD B72.3 and the CDR sequences are based on the murine OKT4A light chain CDRs. The recombinant antibody encoded by this sequence has affinity for CD4 similar to that of OKT4A.

 1 DIQMTQSPSSLSASVGDRVTITCKTSQDINKYMAWYQQTPGKAPRLLIHYTSALQPGIPS 60
 The present sequence is that of the variable region of the kappa light chain from murine monoclonal antibody K20. The antibody recognises the beta I subunit (CD29) of integrins and inhibits activation and proliferation of peripheral T cells induced by anti-CD3 antibodies. Monoclonal antibody K20 is a preferred target for humanisation; the humanised version may be useful as an immunosuppressant. In the humanisation process, the complementarity determining regions (CDKS) of a human antibody with framework regions 70-95% homologous to those of K20 were replaced by the K20
 Expression vectors for producing chimeric monoclonal antibodies which express human constant region and non-human variable region
